

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF CALIFORNIA

TRIMBLE NAVIGATION LTD.,

Plaintiff,

v.

RHS, INC., et al.,

Defendants.

No. C 03-1604 PJH

**ORDER GRANTING AND DENYING
SUMMARY JUDGMENT AND
CLARIFYING CLAIM CONSTRUCTION**

The parties' cross-motions for summary judgment and defendants' motion for leave to amend their amended answer and counterclaims came on for hearing on August 15, 2007 before this court. Plaintiff, Trimble Navigation, Ltd. ("plaintiff"), appeared through its counsel, John Cooper, Lucas Huizar, Nan Joesten, and William Pelton. Defendants RHS, Inc. ("RHS"), CSI Wireless, Inc. ("CSI"), and Satloc Inc. ("Satloc")(collectively "defendants") appeared through their counsel Gerald Dodson, Mark Brown, Erica Wilson, and Steven Tang. The court hereby GRANTS defendants' motion for summary judgment, DENIES plaintiff's motion for summary judgment in part and GRANTS it in part, and GRANTS defendants' motion for leave to amend, for the reasons stated in the court's order dated August 16, 2007, and detailed further as follows:

BACKGROUND

Plaintiff Trimble Navigation, Ltd. is the assignee and owner of U.S. Patent No. 5,987,383 (the "'383 patent"). The '383 patent is directed at the use of GPS-based guidance systems in the farming and agriculture industries. It covers a GPS-based guidance system for agricultural farming capable of recognizing operator-induced deviations made by the operator of a vehicle while driving a spraying device (or similar

1 implement) down a field. The '383 patent's claimed system accounts for such manual
2 deviations by altering its subsequent GPS-based guidance to the operator based on those
3 deviations. Generally speaking, the '383 patent describes the system patented therein as a
4 "form line following method." See Declaration of Erica Wilson ISO Defendants' Motion for
5 Summary Judgment re Non-Infringement ("Wilson Decl."), Exs. 4-5.

6 Defendants are makers and sellers of GPS-based machine guided systems in the
7 agricultural market. Plaintiff alleges that several of defendants' products – specifically, the
8 Outback, Outback S2, LiteStar, LiteStar II, and FreeTrac products ("accused products") –
9 infringe the '383 patent.

10 A. The '383 Patent Claims

11 The '383 patent is comprised of twelve claims. See Wilson Decl., Exs. 4-5. Claims
12 1, 3, 6, and 11 are independent claims that cover: a form line following method (claim 1); a
13 form line following apparatus (claim 3); a method for controlling a vehicle through the form
14 line following method (claim 6); and a method for operating a form line following spraying
15 apparatus (claim 11). See id. The remaining claims are dependent upon these four
16 independent claims. Id. (claims 2, 4, 5, 7-10, and 12 as dependent claims).

17 Plaintiff alleges that defendants' accused products literally infringe all elements of
18 claims 1-7, 9 and 11. Since these claims collectively all depend upon independent claims
19 1, 3, 6, and 11, however, it is these latter four claims that prove most significant for the
20 court's purposes. To that end, the '383 patent provides as follows:

21 **Claim 1.** "A method of form line following, comprising the steps of: defining a first
22 form line using two or more terrestrial locations; defining a second form line using
23 positioning data derived from GPS data and a swathing offset; and defining an
24 updated second form line according to one or more deviations from said second
25 form line while following said second form line defined by said positioning data and
26 said swathing offset, deviating from said second form line to accommodate one or
27 more terrain features, collecting new GPS data during said steps of following and
28 deviating, computing one or more positions therefrom, and using the computed
positions to define the updated second form line."

Claim 3. "A form line following apparatus on a vehicle, comprising a GPS receiver
configured to receive GPS data and GPS correction information and to compute
position information therefrom; and a processor configured to define an updated

1 form line according to said position information while the vehicle is (a) following a
2 previously computed form line having been defined using positioning data derived
3 from earlier received GPS data and a swathing offset, and (b) deviating from the
4 previously computed form line to accommodate one or more terrain features.”

5 **Claim 6.** “A method of form line following, comprising controlling a vehicle so as to
6 follow a form line computed using positioning information provided by one or more
7 sources of GPS information while the vehicle is (a) following a previously computed
8 form line having been defined using earlier positioning information and a swathing
9 offset; and (b) deviating from the previously computed form line to accommodate
10 one or more terrain features encountered while following the previously computed
11 form line.”

12 **Claim 11.** “A method comprising operating a spraying apparatus along a form line
13 so as to apply chemicals to a portion of a field, the form line having been defined
14 according to positions computed while (a) following a previously computed form line
15 having been defined using previously derived positioning information and a swathing
16 offset, and (b) making deviations from the previously computed form line to account
17 for one or more terrain features encountered while operating said spraying
18 apparatus along the previously computed form line.”

19 **B. Procedural History**

20 On April 16, 2003, plaintiff filed a first amended complaint against defendants in this
21 court, following transfer of this case from the Southern District of California. Trimble’s first
22 amended complaint asserted a claim for patent infringement under 35 U.S.C. §§ 271 et
23 seq. and sought damages accordingly. On August 25, 2003, plaintiff filed a second
24 amended complaint that continued to allege a single claim for patent infringement. See
25 generally Second Amended Complaint (“SAC”).

26 Defendants subsequently filed an answer and counterclaim, the latest iteration of
27 which was filed on December 8, 2006. See Defendants’ First Amended Answer and
28 Counterclaims to Plaintiff’s Second Amended Complaint (“Amended Answer and
Counterclaims”). In it, defendants seek a declaration that the ‘383 patent is invalid,
unenforceable, that plaintiff is guilty of inequitable conduct, and that no infringement of the
‘383 patent has occurred. See id. Defendants also assert the affirmative defenses of
laches and prosecution history estoppel, among others.

Both parties have now filed cross-motions for summary judgment. Plaintiff moves
for summary judgment on the issues of (1) infringement; and (2) patent validity.
Defendants, by contrast, seek summary judgment only as to non-infringement. They have,

1 however, also filed a motion for leave to amend their Amended Answer and
2 Counterclaims.¹

3 DISCUSSION

4 A. Summary Judgment Standard

5 Summary judgment is generally appropriate when the evidence shows there is no
6 genuine issue of material fact and the moving party is entitled to judgment as a matter of
7 law. Fed. R. Civ. P. 56(c); Anderson v. Liberty Lobby, Inc., 477 U.S. 242 (1986).

8 B. Infringement

9 Both parties move for summary judgment on the infringement issue. Both parties
10 also agree that the only relevant claims that need be considered here are claims 1, 3, 6,
11 and 11, since the remaining claims are all dependent on these four. Accordingly, the only
12 issue before the court is whether summary judgment should be granted as to infringement
13 or non-infringement of claims 1, 3, 6, and 11.

14 1. infringement standards

15 The court engages in a two-step process in evaluating infringement. First, the court
16 determines the scope and meaning of the claims via claim construction; then, the court
17 compares that construction of the patent against the accused products. See, e.g.,
18 Business Objects, S.A. v. Microstrategy, Inc., 398 F.3d 1366, 1371 (Fed. Cir. 2004)
19 (citations omitted).² While claim construction is a matter of law, infringement itself is a
20 question of fact. See, e.g., Frank's Casing Crew and Rental Tools, Inc. v. Weatherford
21 International, Inc., 389 F.3d 1370, 1376 (Fed. Cir. 2004) (citations omitted).

22 Infringement may be proven by literal infringement, as plaintiff alleges here. A claim

23
24 ¹ Both parties also filed requests to seal numerous exhibits and evidence. All
25 parties' motions to seal were originally DENIED, as stated at the hearing. Defendants' revised
26 motion to seal a limited number of documents was subsequently GRANTED, however, as set
27 forth in docket no. 355.

28 ² Here, the court has already issued its claim construction order construing the
parties' disputed terms and phrases. See Claim Construction Order. Accordingly, it is the
second step of the infringement process that is particularly significant for purposes of the
court's summary judgment analysis.

1 is “literally infringed” if each properly construed claim element directly reads on the accused
 2 product or process. See Jeneric/Pentron Inc. v. Dillon Co., 205 F.3d 1377, 1382 (Fed. Cir.
 3 2000).

4 2. clarification of claim construction order

5 The undisputed evidence before the court demonstrates: defendants’ accused
 6 products generally contain GPS guidance systems that log a vehicle’s position as it makes
 7 an initial pass across the field; on subsequent passes, defendants’ GPS guidance systems
 8 compute individual aim points – i.e., a single position ahead of the vehicle – that
 9 contemporaneously guide vehicles down a pass, based on the vehicle’s real time position
 10 and speed; the aim point is never intercepted; and defendants’ GPS guidance systems only
 11 compute one aim point ahead of the vehicle they are guiding, using the aim points to
 12 continually compute and update cross track values that are used to determine the forward
 13 positions to which the vehicle is directed.³ See Wilson Decl., Exs. 12 at 83-86, 89, 219-
 14 209; 14 at 110; Exs. 15-20, 22-23.

15 According to plaintiff, these guidance systems are identical to the form line following
 16 method claimed by the independent claims of the ‘383 patent. That form line following
 17 method generally refers to the process of defining a first form line, defining a second form
 18 line, and then updating the second form line to account for deviations made while following
 19 the second form line. See Wilson Decl., Exs. 4-5. Plaintiff asserts that defendants’
 20 products infringe on this form line following method because: as described above,
 21 defendants’ products use two or more GPS position data points that are recorded while the
 22 vehicle makes the first pass on a field, thereby defining the first form line; on subsequent
 23 passes, the accused products guide the vehicle along a path across the area to be treated

24
 25 ³ Plaintiff describes the accused products as employing one of three guidance
 26 methods or algorithms: the circle method, the AB method, or the LiteStar method. See Pl. Op.
 27 Br. re MSJ at 2:19-21. Defendants, by contrast describe the three guidance methods in
 28 accordance with their product name (e.g., FreeTrac, LiteStar, etc.). The three methods do
 contain variations in the way they provide contour guidance. The court’s general description
 noted herein, however, applies to all three methods.

1
2 that is one treatment swath width away from the geographic GPS positions that were
3 recorded on the previous pass; and the accused products locate the GPS position from
4 prior passes that is nearest the actual position of the vehicle and adjusts the swath width as
5 necessary in order to guide the vehicle along a path that is one swath width away from the
6 prior pass, in order to avoid skips and overlaps from the prior path. See Declaration of
7 John L. Cooper ISO Plaintiff's MSJ ("Cooper Decl."), Exs. B; C at ¶¶ 18-33.

8 Ultimately, plaintiff's infringement argument is unpersuasive. Preliminarily, the court
9 finds that plaintiff's argument attempts to rehash arguments already raised and resolved by
10 the court in its claim construction order – primarily, the construction to be given the term
11 "form line." As the court noted in its claim construction order, this term proves to be the
12 single most important construction at issue, as it underlies every claim before the court.

13 The claim construction order specifically construed the phrase "form line" to mean
14 "path across the area to be treated," the term "define" to mean "compute," and the term
15 "defining a second form line..." to mean "computing a second path across the area to be
16 treated...". See Claim Construction Order at 13-16, 26. In so construing the term, the court
17 took into account the patent's claim language, the specification and drawings, and noted
18 that the term form line may only be construed as broadly as provided for by the patent
19 itself. See also *Irdeto Access, Inc. v. EchoStar Satellite Corp.*, 383 F.3d 1295, 1300 (Fed.
20 Cir. 2004). The court then noted that a form line must be computed to extend across the
21 path to be treated *before* the operator begins to travel down the path (this does not apply to
22 the first form line, which is defined, or computed, as the vehicle travels down the first pass).
23 See id. at 10. The court also held that the phrase form line does, in fact, refer to a type of
24 line, pursuant to which GPS positions are linked together by straight or curved line
25 approximations, to define the line. See id. at 11.

26 In other words, a second form line is computed, based on the GPS positions logged
27 on the first form line, *before* the operator begins to travel down that second form line, and it
28

1 is computed to extend across the *entire* path that the operator chooses to treat. If the
2 operator deviates while following that second form line, then when he is done traveling that
3 second form line, an updated second form line is computed based on the GPS positions
4 recorded during the deviation. That updated second form line is then used to compute a
5 subsequent form line for the operator to follow, which computation is completed *before* the
6 operator begins traveling down the updated form line.

7 Despite the court's intention to definitively construe the term form line as stated
8 above, plaintiff now contends that the court's construction of form line – i.e., path across
9 the area to be treated – requires neither that the entire path across the area to be treated
10 must be pre-computed ahead of the vehicle's commencement of a pass, nor that the path
11 across the area to be treated may only result from a series of positions linked together to
12 create a line approximation. Rather, plaintiff once again urges the court to construe the
13 path across the area to be treated as a path that is created while the vehicle simultaneously
14 follows the path before it – i.e., that a form line is created as long as there is any GPS
15 computation that is simultaneously occurring. Indeed, it is this premise from which
16 plaintiff's entire infringement argument stems.

17 The court here once again declines plaintiff's invitation to construe the term "form
18 line" as a path across the area to be treated that may be contemporaneously computed, or
19 defined, as the vehicle travels down a given pass on a field. In so rejecting plaintiff's
20 argument, the court also takes the opportunity to clarify its prior claim construction order as
21 stated above – i.e., to make clear that a form line is a path across the area to be treated
22 that, apart from the definition of the first form line, entails the computation of a path to
23 extend across the entirety of the area to be treated by the operator, which shall be
24 computed before the operator begins to traverse along that same form line (and whether
25 such form line is a second path to be treated, or an updated path to be treated that
26 accounts for prior recorded deviations). This clarification supplements, and does not
27 supercede, the court's original claim construction order.
28

3. infringement of claims 1, 3, 6, and 11

Having clarified the court's claim construction order, the court must still compare defendants' accused products with claims 1, 3, 6 and 11 as construed, to determine whether literal infringement has occurred. For the reasons below, the court is persuaded that defendants are correct in arguing that their products do not infringe.

First, and as explained in detail above, defendants' products do not utilize GPS guidance systems that actually define, or compute, form lines. Rather, defendants' products involve the instantaneous computation of forward direction based on GPS data positions and aim points, and refrain from computing an entire path across the area to be treated, which path can be linked by any line approximation. The Outback and LiteStar II products, for example, use individual aim points that are used to contemporaneously guide vehicles down a path based on the vehicle's real time position and speed. See Wilson Decl., Exs. 12 at 83-86, 89; 14 at 110; Exs. 15-20. The FreeTrac and LiteStar products, for their part, provide guidance based on the forward predicted positions for the vehicle, based on real time position, speed and heading. See Wilson Decl., Ex. 12 at 219-20; Exs. 22-23. None of the aim points or forward predicted positions to which a vehicle is guided, however, are ever linked in a line approximation to create a path across the area to be treated, let alone are they so linked prior to the point at which an operator begins to traverse down subsequent paths. Moreover, and as defense counsel noted at the hearing on the instant motions, the aim points utilized by defendants' products to provide guidance to a vehicle, *need not even be located on the same path across the area to be treated that the operator is currently navigating.* See, e.g., Cooper Decl., Ex. I. Plaintiff's own evidence does not dispute, but rather confirms, this description of the way in which defendants' products operate. See id. at Ex. B generally; Ex. C at ¶¶ 18-33.

Second, without ever actually computing form lines to begin with, defendants' products do not actually ever deviate from form lines, for as a matter of logic, a thing cannot deviate from that which does not exist. Nor, by extension, can the products thereby

1 recompute form lines to account for deviations from prior form lines. Without covering
2 these elements, the accused products fail to define updated form lines, as contemplated by
3 the court's claim construction order.

4 Finally, and for the same reasons, defendants' products do not precompute form
5 lines, as contemplated by the terms "defining a second form line" and "updating a second
6 form line" – i.e., they do not allow for an entire form line to be computed to extend across
7 the area to be treated by the operator, *prior to the point at which the operator begins to*
8 *traverse the form line.*

9 As such, none of the four independent claims are literally infringed. Claim 1 for
10 example, covers a "method of form line following" that comprises the steps of "defining a
11 first form line," "defining a second form line," and "defining an updated second form line
12 according to one or more deviations from said second form line while following said second
13 form line...". Following this claim, claims 3, 6, and 11 cover: a "form line following
14 apparatus," a "method of form line following, comprising controlling a vehicle so as to follow
15 [form lines]," and "a method comprising operating a spraying apparatus along a form
16 line...". See Wilson Decl., Exs. 4-5. As described above, however, the undisputed
17 evidence demonstrates that defendants' products never actually define *any* form lines, be it
18 first, second, or updated form lines, since the products never compute and link GPS
19 positions together to approximate a straight or curved line – as required by the court's
20 construction of form line. Nor do the products ever precompute, or recompute any form
21 lines, as is also covered by the '383 patent claims in accordance with the court's claim
22 construction order.

23 This being the case, there is no dispute present as to whether defendants' products
24 actually infringe any claim of the '383 patent. In short, since defendants' products never
25 actually define a form line in the fashion construed by the court in its claim construction
26 order, the products cannot embody the limitations of any claim.

27 The conclusion that no infringement has occurred also extends to plaintiff's
28

1 assertions that defendants have indirectly infringed the '383 patent's claims, by way of
2 active inducement of infringement, and contributory infringement. Both theories of indirect
3 infringement require a finding of direct infringement as a prerequisite. See, e.g., Epcon
4 Gas Syst., Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1033 (Fed. Cir. 2002)(active
5 inducement of infringement standards); DSU Med. Corp. v. JMS Co., 471 F.3d 1293, 1303
6 (Fed. Cir. 2006)(contributory infringement standards). Since plaintiff cannot prevail on the
7 issue of direct infringement, plaintiff cannot prevail as to indirect infringement.

8 Accordingly, the court hereby GRANTS summary judgment in favor of defendants as
9 to non-infringement, and DENIES plaintiff's summary judgment motion as to infringement.

10 C. Invalidity

11 Plaintiff seeks a judgment that the '383 patent is not invalid – on either anticipation
12 or obviousness grounds – as a result of (1) the Korver Patent; (2) the Petersen Article; (3)
13 the TrimFlight references; and (4) the prior art of foam markers and marker arms.
14 Additionally, plaintiff seeks a judgment that claim 3 of the '383 patent was not impermissibly
15 broadened during reexamination.

16 Preliminarily, the legal standards for invalidity based on anticipation and/or
17 obviousness are well-established. Generally, a patent is entitled to a presumption of
18 validity, and an accused infringer must prove invalidity by clear and convincing evidence.
19 See Metabolite Labs., Inc. v. Lab. Corp., 370 F.3d 1354, 1365 (Fed. Cir. 2004). For prior
20 art to anticipate a claim, a single prior art reference must disclose every limitation of the
21 claimed invention and must be sufficient to permit a person having ordinary skill in the art to
22 practice the invention. See Schering Corp., 339 F.3d at 1377; SmithKline Beecham Corp.
23 v. Apotex Corp., 403 F.3d 1331, 1342 (Fed. Cir. 2005). A patent is considered obvious, by
24 contrast, if "the differences between it and the prior art "are such that the subject matter as
25 a whole would have been obvious at the time the invention was made to a person having
26 ordinary skill in the art." 35 U.S.C. § 103(a). To determine obviousness, the court must
27 "examine 1) the scope and the content of the prior art; 2) the level of ordinary skill in the art;

3) the differences between the claimed invention and the prior art; and 4) the objective evidence of nonobviousness.” Iron Grip Barbell Co., Inc. v. USA Sports, Inc., 392 F.3d 1317, 1320 (Fed. Cir. 2004), citing Graham v. John Deere Co., 383 U.S. 1, 17-18 (1966).

1. prior art references

Plaintiff contends that none of the four prior art references noted above anticipate or render obvious the ‘383 patent’s claims. First, plaintiff argues that the Korver patent – which teaches a navigation system that uses GPS data and inertial sensors to avoid skips and overlaps between agricultural swaths – has already been determined *not* to anticipate or render obvious any claims, during reexamination of the ‘383 patent. Second, plaintiff contends that the Petersen Article – which describes the development of software that integrates GPS position information to create a guidance system capable of signaling the operator to take over when approaching a known obstruction – cannot anticipate any claims because the article never discloses deviation based on anything other than a previously known and mapped obstruction in the field. Third, plaintiff contends that references to TrimFlight, plaintiff’s GPS-based guidance system sold for use in agricultural spraying, fail to render any of the ‘383 patent’s claims obvious. Finally, plaintiff asserts that the prior art of foam markers and marker arms was sufficiently deficient that, even if combined with GPS technology, it could not render the ‘383 patent claims obvious.

With respect to each of these references, defendants rely on their expert, Dr. Bevly, to establish grounds for findings of either anticipation or obviousness. See, e.g., Bevly Declaration ISO Defendants’ Opposition to Trimble’s MSJ (“Bevly Opp. Decl.”), Ex. E at ¶¶ 67-70 (opining that a person of ordinary skill in the art would have been capable of modifying system described in Korver Patent in order to compute updated form lines); id. at ¶ 36 (opining that “steps [described in the ‘383 patent claims] are inherent in the system described in the Petersen Article”); id. at ¶ 89 (opining that the ordinary skilled artisan would have been fully capable of writing software code to implement changes to the TrimFlight system, resulting in the method claimed by the ‘383 patent); id. at ¶¶ 101-04

1 (opining that foam markers and marker arms provided “adaptive guidance” that would have
2 been combined with known GPS technology by a skilled artisan to arrive at the guidance
3 system claimed by the ‘383 patent).

4 The court finds that the expert testimony proffered by defendants is sufficient to
5 create a genuine and material issue of fact regarding invalidity based on anticipation or
6 obviousness, in view of the prior art references discussed herein. Dr. Bevly’s testimony
7 does not, as plaintiff suggests, actually opine as to the ultimate fact of anticipation or
8 obviousness. Rather, his testimony properly sets forth opinions as to the underlying facts
9 that could support an ultimate finding of anticipation or obviousness. As such, Dr. Bevly’s
10 testimony is relevant, and sufficiently satisfies defendants’ burden to come forward with
11 evidence on summary judgment that creates a disputed issue of fact on the questions of
12 anticipation or obviousness.

13 For these reasons, the court therefore DENIES plaintiff’s motion for summary
14 judgment as to whether the ‘383 patent is invalid for anticipation or obviousness, based on
15 the four prior art references in question.

16 2. claim broadening during reexamination

17 Plaintiff also challenges defendants’ contention that claim 3 of the ‘383 patent – and
18 all its dependent claims – is invalid by reason of impermissibly broad amendments upon
19 reexamination.

20 A claim is enlarged “if it includes within its scope any subject matter that would not
21 have infringed the original patent.” See Hockerson-Halberstadt, Inc. v. Converse Inc., 183
22 F.3d 1369, 1374 (Fed. Cir. 1999). Whether amendments made during reexamination
23 enlarge the scope of a claim is a matter of claim construction. See In re Freeman, 30 F.3d
24 1459, 1464 (Fed. Cir. 1994). Claim construction is the process of giving proper meaning to
25 the claim language. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d
26 1568, 1572, (Fed. Cir. 1996); Bell Communications Research, Inc. v. Vitalink
27 Communications Corp., 55 F.3d 615, 619 (Fed. Cir. 1995) (stating that claim language
28

1 defines the scope of protection). In determining the meaning of disputed claim terms, a
2 construing court considers the written description, the prosecution history, and extrinsic
3 evidence. See Thermalloy, Inc. v. Aavid Engineering, Inc., 121 F.3d 691, 692-93 (Fed. Cir.
4 1997).

5 Here, the original language of claim 3 – an apparatus claim – required “a form line
6 following apparatus, comprising a *vehicle fitted with* a GPS receiver...”. See Cooper MSJ
7 Decl., Ex. S (emphasis added). The language of claim 3, as amended during
8 reexamination, requires “a form line following apparatus *on a vehicle*, comprising a GPS
9 receiver...”. Id. (emphasis added). Defendants assert that claim 3 has been impermissibly
10 broadened because, while the original claim made clear that the GPS receiver had to be
11 *mounted on* the vehicle, the amended claim covers GPS receivers that are not necessarily
12 mounted on the vehicle, but simply “on” the vehicle in any conceivable way. For example,
13 defendants contend that an individual who carries a GPS receiver in his pocket and who is
14 sitting in the vehicle, now would be covered by the language of claim 3.

15 Ultimately, defendants’ argument is unpersuasive. The court must construe the
16 amended claim in order to determine whether it has been broadened, and it is appropriate
17 to look to the surrounding and original claim language, as well as the prosecution history in
18 doing so. Here, the reexamination history makes clear, as plaintiff points out, that plaintiff’s
19 amendment was simply to clarify the language “fitted with” in order to indicate that the
20 claimed apparatus is actually *on* the vehicle. With the original language, the term “fitted
21 with” in no way tied the GPS receiver to the vehicle, and plaintiff sought to make clear that
22 the receiver was intended to be tied to the vehicle. Indeed, plaintiff specifically represented
23 to the examiner that “no new matter” was being added by the amended language.
24 Moreover, the court construes the phrase “on a vehicle” to mean that the apparatus has to
25 be “mounted” on the vehicle. This construction of “on” is supported by the patent
26 specification. See Cooper MSJ Decl., Ex. O at 5:28-20 (‘383 patent specification stating
27 that GPS receiver is “mounted” on the vehicle). Although defendants assert that the court
28

1 should not look to the specification or other parts of the patent in looking at the amended
2 claims, the court rejects this argument, in view of its duty to construe the amended claim
3 language.

4 In sum, then, the court concludes that the language of claim 3 – and its dependent
5 claims – was not impermissibly broadened through reexamination. Accordingly, the court
6 GRANTS plaintiff's motion for summary judgment as to this limited issue.

7 D. Leave to Amend Answer and Counterclaims

8 Defendants seek leave to amend their Amended Answer and Counterclaims, in
9 order to assert new allegations of inequitable conduct related to plaintiff's purported failure
10 to disclose relevant prior art to the PTO during prosecution of the '383 patent. See
11 Declaration of Dara Tabesh ISO Leave to Amend ("Tabesh Decl."), Ex. A at ¶¶ 71-74.
12 Specifically, defendants seek to add allegations that plaintiff failed to disclose prior art
13 regarding its TrimFlight GPS-based guidance system, including copies of certain
14 "TrimFlight GPS Technical Overviews" and a June 1995 TrimFlight User Guide. See id.
15 Defendants point out that these references include information that explicitly discloses the
16 contour guidance method that is relevant to the '383 patent. See Mot. Leave to Amend at
17 2:3-6.

18 Generally, leave to amend pleadings "shall be freely given when justice so requires."
19 Fed.R.Civ.P. 15(a). In determining whether leave to amend is appropriate, the district court
20 considers "the presence of any of four factors: bad faith, undue delay, prejudice to the
21 opposing party, and/or futility." See Owens v. Kaiser Foundation Health Plan, Inc., 244
22 F.3d 708, 712 (9th Cir. 2001); see also Foman v. Davis, 371 U.S. 178, 182 (1962)(In the
23 absence of any "apparent or declared reason-such as undue delay, bad faith or dilatory
24 motive,... undue prejudice to the opposing party,... futility of amendment, etc.," leave should
25 be freely given). Good cause for amendment must also be shown where, as here,
26 amendment is sought past the deadlines established by the court's pretrial scheduling
27 order. See Fed. R. Civ. Proc. 16(b)(pretrial scheduling order "shall not be modified except
28

1 upon a showing of good cause and by leave of the district judge”); see also Pretrial
2 Scheduling Order (setting forth December 26, 2006 as deadline for amendment of
3 pleadings).

4 Here, the following facts are undisputed: that on February 12, 2007, plaintiff
5 produced for the first time an email from one of the named inventors of the ‘383 patent,
6 suggesting that certain TrimFlight references might constitute valid prior art, and
7 furthermore suggesting that plaintiff might want to avoid disclosure of those references to
8 the PTO; that the 1996 TrimFlight GPS Technical Overview that plaintiff actually disclosed
9 to the PTO did not contain any information regarding TrimFlight’s parallel routes and
10 contour guidance applications; that the 1994 and 1995 TrimFlight GPS Technical
11 Overviews *do* contain discussion of TrimFlight’s parallel routes and contour guidance
12 applications; that defendants did not become aware of, or compare, the three different
13 Technical Overview versions until May 2007, even though all versions had been exchanged
14 throughout discovery in this action; that, on May 30, 2007, defendant requested that
15 plaintiff produce a complete copy of the TrimFlight User Guide that plaintiff had partially
16 produced on February 13, 2007; and that on June 14, 2007, plaintiff produced a complete
17 version of the TrimFlight 1995 User Guide, which also contained discussion of TrimFlight’s
18 parallel routes and countour guidance applications.

19 These facts establish good cause for allowing defendants to amend their First
20 Amended Answer and Counterclaims. From the time defendants first received the
21 inventor’s email suggesting that certain TrimFlight references constituted prior art that
22 plaintiff might want to consider holding back from disclosure, to the time defendants filed
23 the instant motion to amend on July 5, 2007, approximately five months passed. During
24 this time, defendants were engaged in discovering and comparing the differences between
25 the three versions of the TrimFlight GPS Technical Overviews, seeking out a complete
26 copy of the TrimFlight 1995 User Guide, and working with their technical expert to develop
27 and finalize their theory of inequitable conduct. Based on these facts, the court cannot say
28

1 that defendants lacked diligence in pursuing amendment. This is particularly so since, as
2 defendants themselves noted at the hearing on this matter, they were guided by the
3 knowledge that inequitable conduct based on fraud must be alleged with particularity, and it
4 was defendants' desire to be sure of all necessary facts in as reasonable a time as
5 possible, before seeking leave to amend. In sum, then, defendants have stated sufficient
6 facts to establish that they were reasonably diligent in pursuing a good faith basis for their
7 proposed allegations. Good cause for amendment has therefore been shown.

8 The court also finds that the traditional Rule 15 factors additionally counsel in favor
9 of amendment. See, e.g., Foman v. Davis, 371 U.S. at 182. Given the nature of
10 defendants' proposed allegations, defendants are pursuing, in good faith, a valid claim for
11 inequitable conduct. See Li Second Family Ltd. Partnership v. Toshiba Corp., 231 F.3d
12 1373, 1378 (Fed. Cir. 2000)(breach of patent applicant's duty of candor, "which breach can
13 include affirmative misrepresentations of material facts, failure to disclose material
14 information, or submission of false material information, coupled with an intent to deceive,
15 constitutes inequitable conduct"). As such, neither bad faith nor futility of amendment has
16 been demonstrated. The court also finds, as stated above, that defendants have acted
17 reasonably diligently in bringing their motion to amend, thereby obviating any concerns
18 over unreasonable delay.

19 This leaves only the question whether any undue prejudice would result from
20 granting amendment. Given the upcoming trial date of October 29, 2007, allowing
21 defendants to amend their answer and counterclaims at this juncture does, as plaintiff
22 contends, pose a challenge for plaintiff. Nonetheless, considering that defendants' new
23 allegations all relate to evidence and discovery that is in plaintiff's possession and control,
24 the court does not find that this shortened preparation time would be unfairly prejudicial to
25 plaintiff. This is particularly so since, while some additional and expedited discovery may
26 be required, it is necessarily limited only to plaintiff's failure to disclose the relevant prior art
27 alleged. It is not necessary, as plaintiff contends, to conduct discovery as to whether
28

1 plaintiff intentionally omitted reference to the parallel routing or contour guidance
2 applications in the version of the TrimFlight GPS Technical Overview disclosed to the PTO.

3 In sum therefore, given that good cause has been shown, and the lack of
4 demonstrated bad faith, undue delay, undue prejudice, and/or futility, the court hereby
5 GRANTS defendants' motion to amend their Amended Answer and Counterclaims.

6 E. Conclusion

7 For the foregoing reasons, plaintiff's motion for summary judgment is DENIED as to
8 infringement, DENIED as to invalidity based on prior art references, and GRANTED as to
9 invalidity based on claim broadening. Defendants' motion for summary judgment as to
10 non-infringement is GRANTED. Defendants' motion for leave to amend their Amended
11 Answer and Counterclaims is also GRANTED.

12 This order supplements the court's order dated August 16, 2007, docket no. 321.

13
